Parsing validation - synthetic

Chapter 1 Manual context and tables

1.1 Overview of the inspection flow

This is selectable PDF text. It should remain ordinary paper prose, not an FAQ.

The repeated header and footer should not become retrieval evidence.

1.2 Wafer sample readings

Lot	Yield	Disposition
A17	92 percent	reviewed example
B08	87 percent	reviewed example

The table cells are source data. They require row-level review when inferred.

1.3 A question in a technical manual

What is the purpose of this sample?

It tests whether one incidental question changes the whole manual into an FAQ.

1.4 Next numbered section continues the manual structure.

Image OCR and visual absence

Chapter 2 Embedded raster image

This surrounding sentence is selectable text and should remain unflagged.
The large box below is a PNG embedded into the PDF, not selectable text.

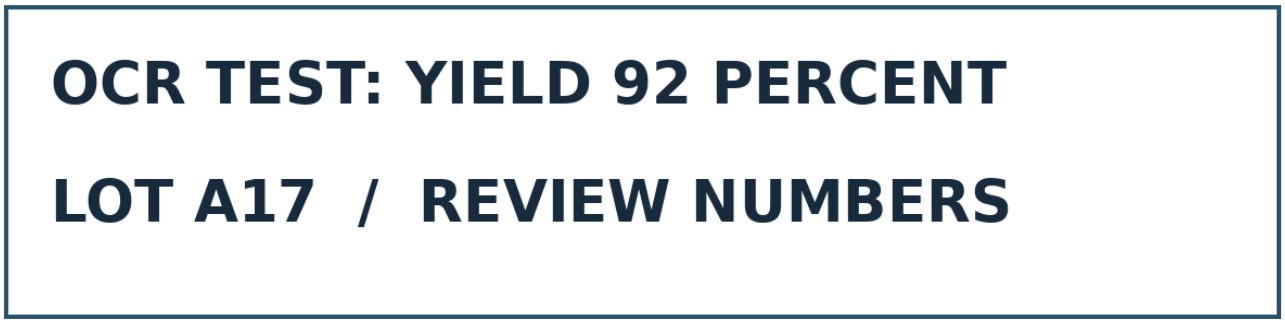

Figure 1. Synthetic OCR image - numbers need source review

2.1 Expected behavior

With Tesseract installed, the OCR text should be marked for review.
Without Tesseract, an explicit unavailable warning and visual gap must remain.
Neither path proves the image contains a reliable numeric fact.

Charts and formulas need review

Chapter 3 Numeric evidence boundary

3.1 Formula source line

GDPW = 3.14 x (wafer radius - edge exclusion)^2 / die area

A plain line is available, but symbol fidelity must be checked before indexing.

3.2 Chart label mapping

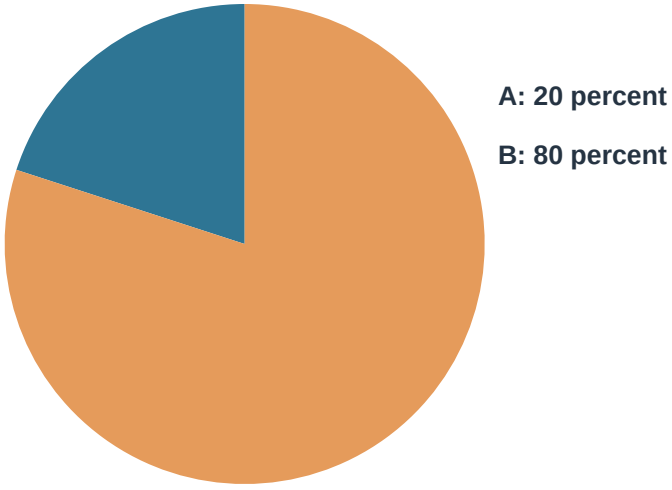

Figure 2. Synthetic chart - spatial relationships require review

3.3 Closing notes

A chart caption alone does not verify category-to-percentage mapping.

A visual-evidence warning should survive the parsing and chunking stages.
